

# K5D

Real-time, Collaboration  
Pipe Design

August 2024

K5D Solution is a **vital real-time collaborative design platform** essential for advanced manufacturing companies in factory construction

## Phase 1

### 2D Design

- AutoCAD and other 2D design programs are used to represent the height and area of parts and structures using lines, boxes, circles, etc
- Drawings are created according to the rules of orthographic or isometric projection for architectural, mechanical, and other designs

## Phase 2

### 3D Design

- Using K5D, Revit, SolidWorks, Inventor, and others to create structures in solid form
- Shortening design lead times and utilizing data post-design for digital twins, PLM, and other applications

## Phase 3

### 4D Design

- Going beyond 3D design application, integrating processes to introduce cutting-edge 3D design techniques on-site
- Utilizing BIM for buildings, factories, and construction to advance towards digital twins

## Hyper Stage

### Design simulation platform

- Adding 4D + simulation / AI capabilities to provide more accurate design support
- Electronic representation of architecture and facilities
- Providing foundational databases for metaverse factories through facility simulation

Optimal for large-scale, high-capacity 3D-based piping design in factories, power plants, shipbuilding/ships, petrochemicals, etc. (automatic customized design for architecture, equipment, components, fire protection, etc.). Supports customer-centric customization with a domestic BIM solution

Automatic 2D / 3D conversion design  
Cross-check functionality through simultaneous collaborative design

Providing design convenience with 6-directional view support (Front, Side (L/R), Top, Back, Bottom) for both 2D and 3D designs  
Output of electronic drawings with scale and non-scale options (ISO drawings)

2D / 3D autonomous conversion  
Cross-check support through simultaneous collaborative design

Shortening project timelines with proprietary PTP (Point To Point) inflection point method for automatic design

Convenient design and layout through inflection point (Point) coordinate settings  
Custom insertion and connection by selecting equipment, materials, and components  
Automatic checking of clearance, interference, and collision between objects

Automatic component insertion support  
Component scale-up support

## Procedures For Building a BIM-based Digital Twin Factory Database

Real-time simultaneous access for 200+ users  
 Rendering support for 300GB+  
 BIM importer support for 100GB+ large-scale  
 and high-capacity

Providing a comprehensive big data database  
 including full sets, piping diagrams (relationship  
 diagrams), quantities, BOM, costs, schedules,  
 areas, volumes, etc.

Embedded algorithms for load  
 balancing, dispatching, authorization,  
 and space (zone) management

- Support for BIM data compatibility and direct importing
- Programmatic workflow for projects, designers, importers, viewers, and simulators

### Building a BIM-based digital twin factory

5D project setup

Creating/registering equipment library

Importing BIM data

Simultaneous access collaborative design modeling

Registering and arranging architectural and facility information

Registering and arranging production equipment baseline information

Managing process BOM calculation systems and issuing construction drawings

# 04 K5D

Providing a robust dashboard for real-time collaborative design status. Visualization of real-time schedules, plans, workloads, statuses, histories, and statistics of design workers, along with data interface API

실시간 접속자 현황 총 접속자 수 : 15명

● 접속중 ● 대기중 ● 종료/미접속

아이디 접속시간

Real-time user status

TCS_3	1h 15m
TCS_4	2h 1m
TCS_5	
TCS_6	2h 25m

## K5D Drawing

Supporting automatic ISO drawing output functionality

Scale / Non-Scale Auto Drawing

Supporting AutoCAD API integration

K5D drawing processing

K5D shape drawing output

AutoCAD output

## K5D Functions

BIM-based design, shape, and attribute data  
Automatic batch input of all files  
(Using GPU parallel processing)  
(Supporting high-speed processing of large volumes)

Building a BIM data database for  
(Automatic quantity calculation, Object  
search, Favorites, Issue marking,  
Collaborative discussion)

Providing technical support for user-  
based operation through Open API  
support. Real-time integration with  
legacy system data

- Supporting on-site consistency with a mobile platform
- VR / AR service support

## K5D Features

Items	K5D Core technology	K5D Features
Real-time & collaborative 3D engine	- Application of industrial, specialized, and large-capacity processing technologies	Developed in-house to meet demand conditions and customer needs
Real-time digital collaboration	- Support for simultaneous collaboration with over 200 users - Real-time synchronization, redo/undo support	Reducing space, time, and cost through collaborative system Early detection and correction of mutual design errors
User interface	- Perfect compatibility with domestic design environments using domestic solutions - Provides intuitive and visual convenience	Supporting automatic design functionality Automation support for integration with external data (Excel, drawings, text)
Visualization / Visibility	- Real-time dashboard support - Support for object information in design targets - Visualization of design errors and interlock support	Supporting various interlock features to enable even beginners can design
User/Admin functionality & history tracking management	- User/administrator, schedule, workload, assigned areas, permissions, security, and history management	Data management for activities based on user/administrator roles
Scalability	- Building digital twins - Establishing metaverse - Building XR / AR immersive education/training systems - Integration of period systems (MES, ERP, FMS, etc.) - ICT convergence	Assetization / Systemization of enterprises
The number of rendering objects	Processing over ten million objects (importer, rendering)	Handling large-scale factory projects
Pricing and maintenance	- More than 30% cheaper than foreign-developed solutions with domestically developed software - Swift response and customized support from a domestic developer	Considering domestic environment and cost-effectiveness, support for customized development and supply

## Expected benefits and expansion of K5D

**Optimal essential digital twin** construction tool for ensuring successful project execution and high-quality business outcomes → **Metaverse Factory**

**Integrated tool focusing on digital twin and metaverse construction for enterprises**

### Expected benefits

Time and cost savings in design

Prevention of design errors

Real-time performance management

Enhanced quality management

**K5D**

### Scalability

ICT-integrated 3D monitoring

Integration of MES / ERP with 3D information asset management

Simulation based on digital twin

Building an education and training system based on the metaverse
